3-

Use the figure above to explain how the movement of particles changes with addition or removal of energy.

When energy is added ; the particles move faster, and this increases the kinetic energy enough for the particles to over come the attraction forces between them causing the particles to move farther apart to change the state of matter.

When energy is removed ; the particles move slower, and this decreases the kinetic energy enough for the particles to come closer that increases the attraction forces between them causing a change in state of matter.

Examine the model below. The particles are undergoing a change in energy.

4. Which statement best describes what is taking place in the images?

- A The kinetic energy of the particles on the right is the greatest of the three images of particles.
- B The particles in the middle have more kinetic energy than the particles on the right.
- C The particles in the middle have less space between them than the particles on the left, which means they have more kinetic energy.
- D Energy was added to the particles on the left to give them more energy than the particles in the middle.
